What Is Tramadol?

Tramadol is a synthetic opioid pain reliever prescribed to reduce moderate to severe pain. It works by changing how the brain and nervous system perceive pain signals, helping patients feel more comfortable and functional during recovery or long-term treatment.

Healthcare providers commonly prescribe Tramadol for:

- Post-surgical pain
- Injury-related discomfort
- Chronic conditions such as arthritis

- Nerve-related pain disorders

Tramadol is available in multiple strengths, including 50mg, 100mg, 200mg, and 300mg. It also comes in two primary forms:

- **Immediate-release tablets**, which provide fast pain relief
- **Extended-release tablets**, designed for consistent pain control over longer periods

This flexibility allows doctors to tailor treatment plans based on each patient's needs.
